Definition of prefix and suffix

Isao Sasano

Prefix, suffix

- prefix and suffix are defined as follows.

prefix(X,Y) :- append(X,Z,Y).

suffix(X,Y) :- append(Z,X,Y).

prefix(X,Y) means that the list X is a prefix of the list Y and suffix(X,Y) means that the list X is a suffix of the list Y.

Examples of prefix and suffix

(ex.)

?- **prefix**(X,[1,2]).

X = [];

X = [1];

X = [1,2];

no

(ex.)

?- **suffix**(X,[1,2]).

X = [1,2];

X = [2];

X = [];

no

prefix and suffix are built-in predicates of GNU Prolog as well as append, so they can be used without entering the definition of them.
